

# Cordova Support

Last Updated: Thursday, July 2, 2020

## Getting Started

The Vibes Cordova plugin allows integration of the Vibes Push SDK into hybrid platforms that support Cordova to generate both Android and iOS applications. This means frameworks like PhoneGap and Ionic can take advantage of our plugin to receive push notifications and other functionality available within our native SDKs. App Inbox messaging is not supported until Version 1.1.0.

## Setup and Usage

The Vibes Cordova plugin is available [here](#). It contains instructions on how to setup and integrate it are available in the [README.md](#).

The Ionic native wrapper for this plugin is available [here](#).

### Key Integration Steps

- Implement basic device and push registration to simple push notifications.
- Enable [association of push to device](#) API or SDK call. This will make a user "known" and allow for platform targeting and segmentation. Note: If you are using cross channel segmentation between channels, the *external\_person\_id* must be the same in the SMS, Push, and Wallet channels.
- Add advanced push options: rich push, notification sounds, deep linking, etc (Optional)

Note: Platform accounts are available via the platform for development and UAT testing.
